In a recent letter[1], Marzlin and Sanders gave a proof of inconsistency implied by the adiabatic theorem(AT), and declared that the standard statetment of the AT, (3) in [1], alone does not ensure that a formal application of it result in correct results, and that the implication of MS inconsistency is important. This has attracted attention from the physics circle[2,3,4]. Though Mazlin and Sanders pointed out that "We show that a perfunctory application of this statement is problematic if ... , regardless of ...", their explanation for a perfunctory use of AT is specious. Their proof of inconsistency is a step by step formal derivation. The only convincing way of refuting it is to point out which step of the derivation is logically invalid. But Marzlin and Sanders failed to do this. Instead, they just gave an explanation, which, as we will show, is wrong. In view of the importance of the AT, the purpose of this note is to point out where their proof goes wrong, why their explanation is specious and the MS inconsistency is just one of the contradictions obtained from wrong reasoning and has nothing to do with physics.

To avoid the infinitely large time variable t , and infinitely small coefficients in (1) of [1], let's get to the scaled dimenssionless time variable $\tau = t/T$, where T is the large total evolution time, during which the Hamiltonian has experienced finite change. The eq.(1) of [1] can be written as

$$i\frac{\partial}{\partial\tau}\psi_n = -i\sum_m\langle E_n|\frac{d}{d\tau}E_m\rangle e^{i\int(E_n-E_m)}\psi_m \quad (1)$$

" $|\psi_{AT}(t)\rangle$ is an approximate solution to the Schrödinger equation (1)" means only " $|\psi_{AT}(t)\rangle \approx |\psi_{EX}(t)\rangle$, where $|\psi_{EX}(t)\rangle$ is the exact solution." Considering the basic mathematical fact that " $|\psi_{AT}(t)\rangle \approx |\psi_{EX}(t)\rangle$ does not imply $|\dot{\psi}_{AT}(t)\rangle \approx |\dot{\psi}_{EX}(t)\rangle$ ", one easily sees that substituting the approximate solution (3) of [1] back into the Schrödinger equation (1) is logically invalid. It leads directly to contradictions (see [5] for the detail),

$$\langle E_n(T\tau)|\frac{d}{d\tau}E_m(T\tau)\rangle \approx 0, \forall m \neq n \quad (2)$$

"Eq.(3) of [1] does not ensure that eq.(1) approximately holds" means the following approximate equation does not hold $i\hbar\frac{\partial}{\partial\tau}U_{AT}(T\tau, T\tau_0) \approx TH(T\tau)U_{AT}(T\tau, T\tau_0)$. Therefore the statement $i\hbar\frac{\partial}{\partial\tau}U_{AT}(T\tau, T\tau_0)^\dagger|E_0(T\tau_0)\rangle \approx$

$$-TU_{AT}(T\tau, T\tau_0)^\dagger H(T\tau)U_{AT}(T\tau, T\tau_0)U_{AT}(T\tau, T\tau_0)^\dagger|E_0(T\tau_0)\rangle \quad (3)$$

is invalid. Combining eq.(3) and $i\hbar\frac{\partial}{\partial\tau} \exp\left\{\frac{i}{\hbar}T\int E_0(T\tau')d\tau'\right\}|E_0(T\tau_0)\rangle$

$= -TU_{AT}(T\tau, T\tau_0)^\dagger H(T\tau)U_{AT}(T\tau, T\tau_0) \exp\left\{\frac{i}{\hbar}T \int E_0(T\tau')d\tau'\right\} |E_0(T\tau_0)\rangle$, which holds exactly, Marzlin and Sanders proved thier claim (4) in [1] and hence the MS inconsistency (6) in [1]. Thus we have pointed out that one of the premises of thier proof, eq.(19), is wrong, so their claim (6) and MS inconsistency (7) are unfounded results.

The paragraph beneath (9) in [1] is their explanation. Let's show, it is wrong. In fact, substitute (3) of [1] back into the Schrödinger equation (1), means neglect of the non-diagonal matrix elements terms, which **are rapidly oscillating**. But this neglect still leads to contradictions (2). Expanding $|\frac{d}{d\tau}E_m(T\tau)\rangle$ in terms of $|E_n(T\tau)\rangle$ and using (2), one gets $|\frac{d}{d\tau}E_m(T\tau)\rangle \approx |E_m(T\tau)\rangle \langle E_m(T\tau)|\frac{d}{d\tau}E_m(\check{R}(\tau))\rangle$. Taking the inner products of both sides with $|E_m(T\tau_0)\rangle$, we get $\frac{d}{d\tau} \langle E_m(T\tau_0)|E_m(T\tau)\rangle \approx \langle E_m(T\tau)|\frac{d}{d\tau}E_m(T\tau)\rangle \langle E_m(T\tau_0)|E_m(T\tau)\rangle$. Solving this differential equation gives the MS inconsistency $\langle E_m(T\tau_0)|E_m(T\tau)\rangle \approx \exp\{\int_{\tau_0}^{\tau} \langle E_m(T\tau')|\frac{d}{d\tau}E_m(T\tau')\rangle d\tau'\}$.

Thus we have shown that the explanation of [1] is wrong, and MS inconsistency is just one of the contradictions from wrong reasoning, it has nothing to do with physics and is not worth noting at all.
